NEURODIVERSITY AND ARCHAEOLOGICAL PRACTICE

Amy Talbot and Rosie Loftus

In this article Amy Talbot and Rosie Loftus share their experiences of how dyslexia and dyspraxia have impacted their working lives. Their stories illustrate the importance of encouraging individuals to make employers aware of their conditions, to educate line managers so that they can raise awareness and provide support, and to encourage change to working practices that would be of benefit to all staff.

Spotlight on invisible disabilities

As the CIfA policy statement highlights, all people should be treated equally and that encompasses both visible and invisible disabilities. One example of an invisible disability includes neurodiversity. Estimated to affect 15 per cent of the population, neurodivergent individuals process and interpret information in different ways with attention deficit or attention deficit hyperactivity characteristics. As with dyslexia, dyspraxia is the condition affecting motor coordination. Often a visual processing issue, it has been suggested that I use a visor instead, which solves the issues but impacts my motor functions, so I struggle with carrying tools and have visual stress.

Amy Talbot

I was diagnosed through the University of Bradford in October 2019. Having a name for my feeling of ‘I understand’ but can’t prove it in a way that everyone else understands has been incredible.

Despite being a fluent reader, my dyslexia diagnosis came from the assessor realising I cannot sequence concepts, words, letters or numbers, and that I rely on memory for how something should look, feel or sound when writing.

One aspect of receiving a dyslexia diagnosis has been reviewing how to use Microsoft Word. I could never ‘see’ words in italics, and now I know this is a dyslexic trait I feel much more capable to undertake desk-based work.

On complicated archaeological features it took me a long time to verbally explain what was occurring, even though in my head I understood. This would often lead to assumptions that I was incompetent or inexperienced and so I would be treated as such. Points on a compass and directions on section points are still a nightmare! I am very reliant on writing down everything and had to ask when on site for pro-forma sheets to be created so that I knew what information I needed to record. This was because there are differences between units, and often there was no recording manual on site, since it was expected that everyone already knew how to fill out context and drawing sheets. I struggled during my time in fieldwork as I frequently felt stupid and overwhelmed. This had a detrimental effect on my mental health.

Rosie Loftus

Unlike Amy I was diagnosed with dyslexia in primary school and when I was a child it felt like a bit of a monster following me round. It meant that I went to special classes in school time, so I missed the more fun classes; I have very poor hand–eye coordination so I must take the long way around to get to the same results as a non-dyslexic person, I have become a fantastic problem solver. I am very patient, and I am very determined.

I found when I got my first job, I struggled with drawing plans and sections. It took a project officer on a site to realise that my brain was not registering the blue squares on Permatrace. He made me a red board; problem solved... almost. On a bad day it still feels like ‘Baby Shark’ is playing on one side of my brain as someone plays the cymbals on the other. When it is safe, I put on my headphones and listen to an audio book; this switches off the part of my brain that is angry and noisy and allows me to do my job effectively.

One of the biggest issues I deal with on site now is health and safety enforcing goggles. I am not the only staff member on site who has dizzy spells because of visual stress. This has nothing to do with my eyesight and is instead a visual processing issue. It has been suggested that I use a visor instead, which solves the issues but singles me out as having a disability.

Being undiagnosed during my time in fieldwork meant there was no support. During a brief period where I worked with my husband, he was able to create pro-forma sheets for me, or at least give me a list of what information I needed to include, including the terminology and why it was important. Standardised industry pro-forma sheets across all CIfA Registered Organisations, including prompts, drawing conventions and a terminology glossary would be useful! Like Rosie I also have dyspraxic elements as my body cannot sequence how to do basic motor functions, so I struggle with carrying tools and have visual stress.
